

ABSTRACT OF THE DISCLOSURE

A side panel of a refrigerator door includes a cover part having a side shape of a refrigerator door, an insertion rib formed extended with a certain
5 thickness and height at one marginal portion of the cover part, a hinge insertion part formed at the other side of the cover part and coupled to a hinge coupled to a refrigerator body, and a coupling unit formed at one side of the insertion rib and fixedly coupled by being caught at a front panel of the refrigerator door. In a coupling structure of the side panel, the coupling unit of the side panel is fixedly
10 engaged into a through hole of the front panel. Accordingly, the side panel and the front panel can be coupled firmly and an assembling operation is easy.
